* excludes GST

Welcome

Asthma is a manageable condition. With effective treatment, most people with asthma will enjoy a normal, healthy life. However, asthma continues to have a significant impact on the lives of many people living with, and others caring for people with the condition.

Many people in government and the general community believe asthma is under control. However, current evidence highlights that asthma self-management and control is suboptimal for many people in the community.

Consumer market research of more than 1,000 people highlighted that people with poorly controlled asthma primarily see it as a physical health issue (80%), with few thinking that it has other effects on their life. However, the report is evidence that poorly controlled asthma has serious impacts on day-to-day lives in the workplace, family life, leisure time and relationships.

A proactive approach towards asthma self-management is seldom reported by people, with many experiencing daily symptoms, struggling with medication adherence and feeling ill-informed and disempowered about their condition.

There is a lot more that can be done to help people with asthma take control of their condition. There are potentially powerful interventions that can be adopted within systems that provide support for people with asthma. These include hospitals, community health services, general practice, community pharmacy, Primary Health Networks, and consumer organisations such as Asthma Australia.

About the Asthma Symposia Series

Asthma Australia together with your local Asthma Foundation is pleased to present the 2016 Asthma Symposia series and we encourage health professionals involved in all aspects of asthma and allergy related care to attend. With a wide and varied program, incorporating research and clinical updates through to practical information on device technique, you will find something to meet your professional needs.

Registration Fees

\$120* Standard registration

\$100* Early bird - ends 15 July

\$80* Student concession

* excludes GST

Keynote Speaker

Associate Professor Helen Reddel

Associate Professor Helen Reddel is a respiratory physician mainly working on primary care research and guidelines for asthma and COPD. She is a Research Leader at the Woolcock Institute of Medical Research, Chair of the Science Committee of GINA, Clinical Adviser for the Australian Centre for Airways disease Monitoring (ACAM), and a member of the Australian Asthma Handbook Guidelines Committee.

A/Prof Reddel's current research focusses on practical strategies to improve asthma and COPD management, with particular interest in adherence and inhaler technique; collaborations with GPs, pharmacists and practice nurses; and population monitoring of asthma and COPD. She has a strong focus on improving communication between patients and health professionals, and on making guidelines not only evidence-based, but also practical and practice-centred.

Thank you

Asthma Australia would like to thank its partners and sponsors for their generous support which has enabled them to bring this symposia series to you.
