

**Development and validation of a computerised clinical decision support system for people with and without dementia having a medication review**

Researchers at the Cognitive Decline Partnership Centre at the University of Sydney are developing and validating a computerised clinical decision support system to be used during medication review for people with and without dementia.

We have developed several goal-directed medication risk assessment measures that can be used during medication review. The aim of this project is to incorporate these measures into new software.

Researchers are seeking General Practitioners with experience conducting medication reviews for people with and without dementia who would be willing to participate in a focus group or interview to contribute to the development of the new software. Eligible participants will be involved in two 1-hour focus group or interview sessions during the development of the software.

If you are interested in participating in this important research, contact Dr Lisa Kouladjian O'Donnell at [lisa.kouladjian@sydney.edu.au](mailto:lisa.kouladjian@sydney.edu.au) or (02) 9926 4934 for a copy of the participant information sheet and other additional details.
